<p>DIAGONAL INVESTIGATION</p> <p>#4</p> <p>DO THE DIAGONALS BISECT VERTEX ANGLES?</p> <p>Yes</p>		<p>DIAGONAL INVESTIGATION</p> <p>#3</p> <p>ARE THE DIAGONALS PERPENDICULAR?</p> <p>Yes</p>

A parallelogram is a parallelogram with 4 congruent sides. The opposite sides are parallel and the opposite angles are congruent.

$$\overline{AC} = \underline{2.2 \text{ cm}}$$

$$\overline{BD} = \underline{3.8 \text{ cm}}$$

Since \overline{AC} is not congruent to \overline{BD} , then the diagonals of rhombuses are not congruent.

$m\overline{DE} = \underline{1.9 \text{ cm}}$
 $m\overline{BE} = \underline{1.9 \text{ cm}}$
 Since $m\overline{DE} = m\overline{BE}$ then diagonal \overline{DB} has been bisected.
 $m\overline{AE} = \underline{1.1 \text{ cm}}$
 $m\overline{CE} = \underline{1.1 \text{ cm}}$
 Since $m\overline{AE} = m\overline{CE}$ then diagonal \overline{AC} has been bisected.

$\angle DEC = \underline{90^\circ}$
 $\angle CEB = \underline{90^\circ}$
 $\angle BEA = \underline{90^\circ}$
 $\angle AED = \underline{90^\circ}$
 In order for the diagonals to be perpendicular, the angles formed at the intersection of the diagonals must be 90° . Since all of these angles are perpendicular.

$m\angle DAC = \underline{60^\circ}$
 $m\angle CAB = \underline{60^\circ}$
 Since $\angle DAC$ is congruent to $\angle CAB$, then $\angle DAB$ (which is a vertex angle) has been bisected.
 $m\angle ABD = \underline{30^\circ}$
 $m\angle DBC = \underline{30^\circ}$
 Since $\angle ABD$ is congruent to $\angle DBC$, then $\angle ABC$ (which is a vertex angle) has been bisected.
