

There are many things a nucleus can be compared to. One of them is a heart. These two things are similar because humans cannot live without a heart and cells can't live without a nucleus. Also these two things help send stuff through out your body. The heart sends blood through your body and the nucleus sends messages from the DNA. Both the heart and the nucleus have different parts that help it function. The heart has different arteries and veins while the nucleus has the nucleolus. In conclusion, the heart and the nucleus have a lot in common and share a lot of similarities.
