

Point-Slope Form:

$$y - 3 = 2(x + 4)$$

Slope of this line = 2

This line passes through the point $(-4, 3)$

$$\begin{array}{l} (x - x_1) \\ y - y_1 \end{array}$$

$$y - 3 = 2(x + 4) \quad \text{Point-Slope Form}$$

the point used to write this equation is still $(-4, 3)$

Could be written as: $y = 2(x + 4) + 3$

The vertex is $(-4, 3)$
just like the line above passes through $(-4, 3)$

Now this looks a lot like the equation of an Absolute Value

Absolute Value Equations:

$$y = a|x - h| + k$$

Vertex: (h, k)

Slope of the sides: $\pm a$

V-shape Opens:

Up if a is pos

Down if a is neg

$$y = 2|x + 4| - 9 \quad \text{Vertex: } (-4, -9)$$

This could be written as:

$$y + 9 = 2|x + 4|$$

$$y = -2(x - 1)^2 + 5$$

What will this graph look like?

parabola opens down

What will the vertex be?

1 Rt 5 up vertex (1, 5)

What numbers would you use in a table to find the rest of the graph?

x	y
1	3
3	-3

$$y = 3(x + 4)^2 - 7$$

4 left 7 down

Vertex (-4, -7)

x	y
-5	-4
-6	5

a) $y = -\frac{3}{2}x$

X	Y	$\frac{Y}{X}$
-4	6	-1.5
-2	3	-1.5
2	-3	-1.5
4	-6	-1.5
6	-9	-1.5

constant ratio

b) $y = \frac{1}{4}x - 3$

X	Y	$\frac{Y}{X}$
8	-1	-0.125
4	-2	-0.5
-4	-4	1
-8	-5	0.625
16	1	0.0625

3. If the ratio of $\frac{Y}{X}$ is constant the function is called Direct Variation.

a) Which of these equations is Direct Variation?

A $y = -\frac{2}{3}x$

b) What is the characteristic of the graph of a Direct Variation?

Line passes through
the origin

c) All Direct Variation Functions have a Variation Constant.
What is the Variation Constant of the Direct Variation Function
you identified in part a)?

$$K = -1.5$$

d) How is the Variation Constant related to the graph?

slope
