

**Theorem****Factor Theorem**

The expression  $x - a$  is a linear factor of a polynomial if and only if the value  $a$  is a zero of the related polynomial function.

Factor this quadratic  $x^2 + 3x - 4 = (x + 4)(x - 1)$

**Summary****Equivalent Statements about Polynomials**

- ①  $-4$  is a **solution** of  $x^2 + 3x - 4 = 0$ .
- ②  $-4$  is an **x-intercept** of the graph of  $y = x^2 + 3x - 4$ .
- ③  $-4$  is a **zero** of  $y = x^2 + 3x - 4$ .
- ④  $x + 4$  is a **factor** of  $x^2 + 3x - 4$ .

Is 8 a factor of 104?

$$\begin{array}{r} 13 \\ 8 \overline{) 104} \\ \underline{8} \phantom{00} \\ 24 \phantom{00} \\ \underline{24} \\ 0 \end{array}$$

Yes, the remainder is zero

Is 6 a factor of 81?

$$\begin{array}{r} 13 \\ 6 \overline{) 81} \\ \underline{18} \phantom{00} \\ 63 \phantom{00} \\ \underline{60} \\ 3 \end{array}$$

No, the remainder is not zero

A number is a factor of another number if and only if the quotient has a **remainder of zero**

Is  $x + 3$  a factor of the following function?:

Only if the remainder is zero!

$$f(x) = 2x^3 + 14x^2 + 19x - 15$$

$$f(-3) = 0$$

Or do the division and  $R = 0$

$x+3$  is therefore, a factor.

If  $\frac{2x^3 + 14x^2 + 19x - 15}{x + 3} = 2x^2 + 8x - 5$

then  $f(x) = 2x^3 + 14x^2 + 19x - 15 = (x + 3)(2x^2 + 8x - 5)$

What is the zero of  $x + 3$ ?  $-3$

What should happen if you replace  $x$  with  $-3$ ?

$$f(-3) = 0$$

What if  $f(-3) \neq 0$ ?  $-3$  is not a zero so  $(x + 3)$  is not a factor!

Is  $(x - 2)$  a factor of  $5x^3 + 7x^2 - 3x + 8$ ?

2

When you divide  
R = 70

$(x - 2)$  NOT a factor

Is  $x + 2$  a factor of  $10x^3 - x^2 + 3x - 4$ ?

NO

remainder is -94

Either perform the division  
or find  $f(-2) = -94$

What is the remainder of this quotient?

$$\frac{6x^3 + 7x^2 - 8x + 12}{x - 3}$$

Either perform the division  
or find  $f(3) = 213$  **No, the remainder is 213.**
