

Take a small white board, rag, and marker

What is the difference between these two terms?

Equation

Must have an
= sign

Expression

Has no = sign

Write an expression that models each statement exactly as written.

1. Five less than a number. $A - 5$

2. The product of a number and six. $B \cdot 6$

3. The sum of twelve and a number. $12 + x$

4. The difference of a number and three. $Q - 3$

5. Eight times the quantity one plus a number. $8(1 + Q)$

Model each statement.

1. The boat can carry up to 8 passengers. $b \leq 8$

2. You need at least a 93 on the quiz to get an A. $G \geq 93$

3. The wheelbarrow can hold no more than 15 bricks. $w \leq 15$

4. The Federal minimum wage is \$7.25 per hour. $M \geq 7.25$

What is this called? $5c^4 - 8c^3 + 1.3c^2 - 118$
A variable expression

How many terms are in this expression? 4

What is a term?

a number, a variable, or the product of a number and one or more variables.
Terms in a variable expression are separated by Addition and Subtraction.

What is a coefficient? The # being multiplied by a variable.
Usually found in front of the variable.

Simplify. $6w^2 - 4 + 5w - 3 + w^2 - 8w$

Like Terms: Terms with the same variable(s) with the same exponent(s)

You combine like terms by adding and subtracting using the coefficients.

$$\begin{array}{l} 1 \\ 2 \end{array} \quad \begin{array}{l} 6w^2 + w^2 - 4 - 3 + 5w - 8w \\ 7w^2 - 3w \rightarrow \text{Standard Form} \end{array}$$

Simplify:

$$-6a^2b + ab^2 - 4b^2a + 7ab - 2a^2b - 5ab^2$$

$$\begin{array}{lll} \underbrace{-6a^2b - 2a^2b}_{-8a^2b} & \underbrace{+ab^2 - 4b^2a - 5ab^2}_{-8ab^2} & + 7ab \\ & & + 7ab \end{array}$$

$$= -8a^2b - 8ab^2 + 7ab$$

Simplify. $\frac{7}{3}(w+y) - \frac{1}{3}(w+y)$

$$\begin{aligned} &= \frac{7}{3}w + \frac{7}{3}y - \frac{1}{3}w - \frac{1}{3}y \\ &= \frac{6}{3}w + \frac{6}{3}y \\ &= 2w + 2y \end{aligned}$$

Write an expression for the perimeter of this figure.

$$\begin{aligned}
 &2a \\
 &+ 4b - a \\
 &+ a + 3b \\
 &+ 0.5a \\
 &+ 3a + 4 \\
 &+ a + b \\
 &+ a - 1 \\
 &+ 2b
 \end{aligned}$$

$$7.5a + 10b + 3$$

You evaluate a variable expression by

Substituting values for each variable
Then simplify the expression

Evaluate this expression for $C = 8$ and $D = -12$

1. $D^2 - 7CD$

$$= (-12)^2 - 7(8)(-12)$$

$$= 144 + 672 = 816$$

You can now finish Hwk #3
