

## Sec 6-4: Solving Polynomial Equations

- Solve by factoring:  
finds both real and imaginary zeros.
- Solve by graphing:  
finds only real zeros

Every polynomial has exactly  $n$  solutions, where  $n$  is the degree of the polynomial.

Some of these solutions may be imaginary so not all solutions can be found by graphing.

Solve by factoring (same question as if I asked you to find the zeros of the function!)

Find ALL Complex solutions.

this means to find both real and imaginary solutions

$$6x^6 - 12x^4 - 378x^2 = 0$$

$$6x^2(x^4 - 2x^2 - 63) = 0$$

$$\begin{array}{c} -63 \\ -9 \quad +7 \\ -2 \end{array}$$

$$6x^2(x^2 - 9)(x^2 + 7) = 0$$

$$6x^2(x \pm 3)(x^2 + 7) = 0$$

$$x = 0, \pm 3, \pm i\sqrt{7}$$

$$\begin{aligned} x^2 + 7 &= 0 \\ \sqrt{x^2} &= \pm\sqrt{-7} \\ x &= \pm i\sqrt{7} \end{aligned}$$

Find ALL Complex solutions.

$$x^4 + 2x^2 - 24 = 0$$

$$\begin{array}{c} -24 \\ +6 \quad -4 \\ +2 \end{array}$$

$$(x^2 + 6)(x^2 - 4) = 0$$

$$(x^2 + 6)(x \pm 2) = 0$$

$$\begin{aligned} x^2 + 6 &= 0 \\ \sqrt{x^2} &= \pm\sqrt{-6} \end{aligned}$$

$$x = \pm i\sqrt{6} \quad x = \pm 2$$

Find ALL Complex solutions.

$$x^3 + 3x^2 - 4x - 12 = 0$$

How would you factor a polynomial with four terms?

	$x$	$+3$
$x^2$	$x^3$	$+3x^2$
$-4$	$-4x$	$-12$

 $\rightarrow (x+3)(x^2-4) = 0$   
 $(x+3)(x+2)(x-2) = 0$   
 $x = -3, -2, 2$

Find ALL Complex solutions.

Another technique  
to factor 4 terms is  
called:

Factor By  
Grouping

$$2x^3 - 3x^2 + 10x - 15 = 0$$

$$\underbrace{2x^3 - 3x^2}_{\text{GCF}} + \underbrace{10x - 15}_{\text{GCF}} = 0$$

$$x^2(2x-3) + 5(2x-3) = 0$$

$$(2x-3)(x^2+5) = 0$$

$$x = \frac{3}{2}, \pm i\sqrt{5}$$

$$x^2 + 5 = 0$$

$$\sqrt{x^2} = \sqrt{-5}$$

Find ALL Complex solutions.

$$2x^5 - 72x = 0$$

$$2x(x^4 - 36) = 0$$

$$2x(x^2 - 6)(x^2 + 6) = 0$$

$$x = 0, \pm\sqrt{6}, \pm i\sqrt{6}$$

$$x^2 - 6 = 0 \rightarrow \sqrt{x^2} = \sqrt{6}$$

$$x^2 + 6 = 0 \rightarrow \sqrt{x^2} = \sqrt{-6}$$

Find ALL Complex solutions.

$$x^5 + 9x^3 - 36x = 0$$

$$x(x^4 + 9x^2 - 36) = 0$$

$$x(x^2 + 12)(x^2 - 3) = 0$$

$$\begin{array}{c} -36 \\ +12 \quad -9 \end{array}$$

$$x = 0$$

$$x^2 + 12 = 0$$

$$x^2 = -12$$

$$x = \pm\sqrt{-12} = \pm 2i\sqrt{3}$$

$$x^2 - 3 = 0$$

$$x^2 = 3$$

$$x = \pm\sqrt{3}$$

Find ALL Complex solutions.

$$2x^4 + x^2 - x = 16x^3 - 13x^2 + 111x$$

$$2x^4 - 16x^3 + 14x^2 - 112x = 0$$

NOW START FACTORING

$$2x(x^3 - 8x^2 + 7x - 56) = 0$$

First step:  
move all terms to  
the left side &  
simplify

$$x^2 + 7 = 0$$

$$\sqrt{x^2} = \sqrt{-7}$$

$x^2$	$x^3$	$-8x^2$
$+7$	$+7x$	$-56$

 $\rightarrow 2x(x-8)(x^2+7) = 0$

$$\rightarrow x=0 \quad \rightarrow x=8$$

$$x^2 + 7 = 0$$

$$\sqrt{x^2} = \sqrt{-7}$$

$$x = \pm i\sqrt{7}$$

$$x = 0, 8, \pm i\sqrt{7}$$
