1. Find the period of this function:

2. Find the Amplitude, Period, and Equation of the Midline for this periodic function.

3. Find the amplitude, period, and equation of the midline.

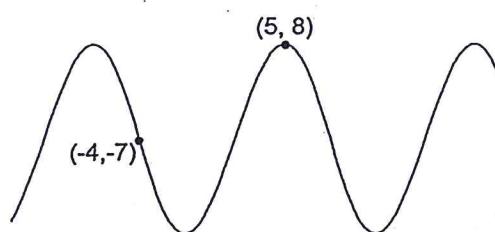

Period =

Amplitude =

Eq of Midline :

4. Find the amplitude, period, and equation of the midline.

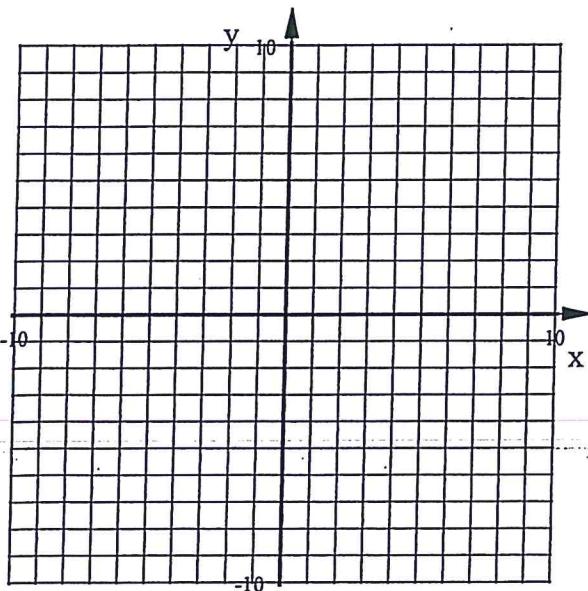

Period =

Amplitude =

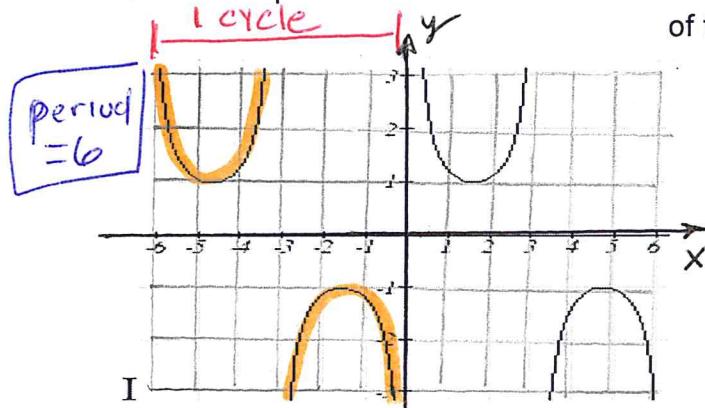

Eq of Midline :

3. Sketch a periodic function with the following characteristics:

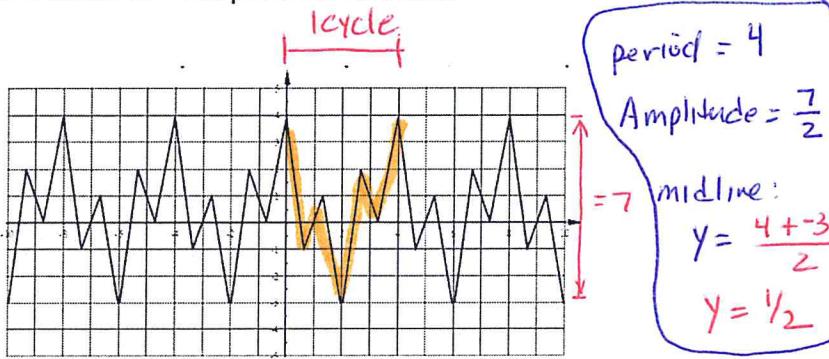

Period = 4      Amplitude = 7      Midline:  $y = -2$

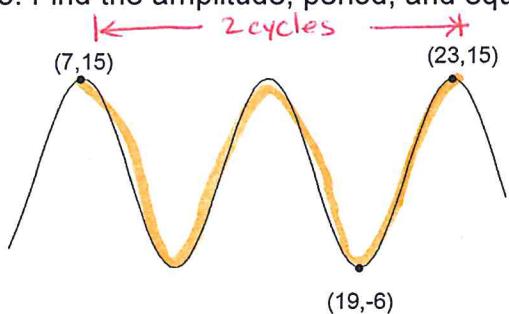

1. Find the period of this function:

2. Find the Amplitude, Period, and Equation of the Midline for this periodic function.

3. Find the amplitude, period, and equation of the midline.

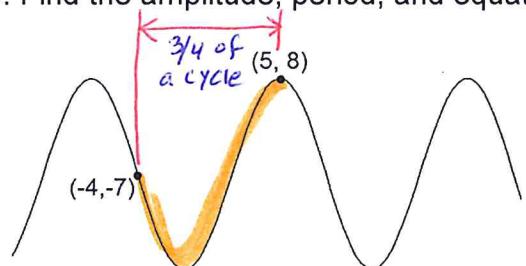

$$\text{Period} = \frac{23-7}{2} = \frac{16}{2} = 8$$

$$\text{Amplitude} = \frac{15-(-6)}{2} = \frac{21}{2} = 10.5$$

$$\text{Eq of Midline: } \frac{15+(-6)}{2} \rightarrow y = \frac{9}{2}$$

4. Find the amplitude, period, and equation of the midline.

$$\text{Period} = \frac{5-(-4)}{\frac{3}{4}} = \frac{9}{\frac{3}{4}} = 9 \cdot \frac{4}{3} = 12$$

$$\text{Amplitude} = 8 - (-7) = 15$$

$$\text{Eq of Midline: } y = -7$$

3. Sketch a periodic function with the following characteristics:

Period = 4 Amplitude = 7 Midline:  $y = -2$ 

There are an infinite number of possibilities. An example is given
