

1. Write the equation of this parabola in Vertex Form: $y = a(x - h)^2 + k$ 

For problems 2 and 3: For each quadratic answer the following:

- State the equation for the line of symmetry
- State the coordinates of the vertex
- State the y-intercept
- Tell if the parabola has a maximum or a minimum.

2. $y = -2x^2 - 16x + 13$

3. $y = 3(x - 1)^2 + 6$

4. Find all EXACT Complex solutions using FACTORING:

a) $6x^2 - 15x = 0$

b) $2x^2 + 6x - 20 = 0$

c) $2x^2 + x - 10 = 0$

d) $2x^3 + 7x^2 - 18x - 63 = 0$

5. Find all EXACT Complex solutions using SQUARE ROOTS:

a) $5 + 3x^2 + 57 = 8$

b) $(x + 3)^2 + 11 = 47,$

6. Find all Complex solutions using the QUADRATIC FORMULA. Give all real solutions rounded to the nearest hundredth and simplify all imaginary solutions.

a) $4x^2 + 20x - 1 = 0$

b) $x^2 - 4x + 29 = 0$

7. Find all EXACT Complex solutions by COMPLETING THE SQUARE.

a) $x^2 + 8x - 32 = 0$

b) $2x^2 - 12x = 20$

On the final exam you will be given a group of quadratic equations to solve using any method you wish but you'll be required to use each method a given number of times.

8. An object is shot into the air from the top of a 30 foot building. The following equation models the height of the object as a function of time. $h(t) = -16t^2 + 200t + 30$

- Find the time to reach it's maximum height.
- Find the maximum height.
- Find the time it takes for the object to return to the ground.
- Find the time it takes for the object to reach a height of 100 feet.

9. A company wants to minimize their costs. The following equation models the company's costs, $C(p)$, as a function of the number of parts produced each day: $C(p) = 0.75p^2 - 120p + 8500$

- Find the number of parts they should produce each day in order to minimize their costs.
- Find the minimum costs.

10. Find each product: a) $(2 + 4i)(5 - 3i)$ b) $(6 + 7i)(6 - 7i)$
