

1. Complete this proof of Theorem 2-5

Given: Angles G and H are supplementary  
and  $\angle G \cong \angle H$

Prove: Angles G and H are both right angles.

| Steps                                                            | Reasons                           |
|------------------------------------------------------------------|-----------------------------------|
| 1. Angles G and H are supplementary<br>$\angle G \cong \angle H$ | 1. Given                          |
| 2. $\angle G + \angle H = 180^\circ$                             | 2. Def of Suppl.                  |
| 3. $\angle G + \angle G = 180^\circ$                             | 3. Substitution                   |
| 4. $2 \cdot \angle G = 180^\circ$                                | 4. Simplify or combine like terms |
| 5. $\angle G = 90^\circ$                                         | 5. Div Prop =                     |
| 6. $\angle H = 90^\circ$                                         | 6. Subst.                         |

Write and solve an equation to find the measure of each pair of angles described:

1.  $\angle Q$  is fifteen more than twice its complement

$25^\circ$  &  $65^\circ$   $\angle Q + X = 90$

$\angle Q = 2X + 15$

$X = 25$

2.  $\angle A$  is three times as large as its supplement.

$2x + 15 + x = 90$   
 $\angle A = 3X$   $\angle A + X = 180$   
 $3x + x = 180 \rightarrow X = 45^\circ$

$45^\circ$  &  $135^\circ$

Find the value of each variable.

Write two equations such as:

$y = 2x$  (vert angles =)  
and  
 $y + x + y + 5 = 180$  (supple angles)

Substitute to get:  
 $2x + x + 2x + 5 = 180$

Solve for x:  $x = 35$   
then find y:  $y = 2x = 2(35) = 70$

$y = 2x$   
 $y + x + y + 5 = 180$   
 $2x + x + 5 = 180$

$2(2x) + x + 5 = 180$

Name a pair of adjacent angles.

$\angle ABD$  &  $\angle DBC$

OR  
 $\angle ADB$  &  $\angle CDB$

Name a pair of supplementary angles.
